

EliteBot strategy rulebook

Current presets and proposed refinements

3 October 2026 | Elitetrade

EliteBot currently implements three baseline strategies: Trend, Scalping, and Breakout. This rulebook explains how each preset generates a signal, how the shared engine sizes and protects an order, and how the rules could be refined for testing.

Current rules describe the repository implementation. **Proposed rules** describe a new specification that would need implementation and validation. The current execution engine accepts MT5 demo accounts only. This document does not activate a bot or change its trading settings.

The three current presets

Preset	Chart	Signal
Trend	M15	EMA 20 crosses EMA 50
Scalping	M5	EMA 9 crosses EMA 21
Breakout	M15	Close outside the preceding 20 bars

M5 means five-minute candles; M15 means fifteen-minute candles; H1 means hourly candles. An EMA is an exponential moving average of closing prices. The shorter EMA responds faster to recent price changes.

What makes a signal eligible

All three presets use completed candles. A forming candle is excluded even if its current price appears to satisfy the rule. Invalid, duplicate, stale, or interrupted candle history is rejected. The current minimum history is 52 closed bars for Trend, 23 for Scalping, and 22 for Breakout. The provider requests up to 120 bars.

A signal indicates a possible entry. The engine still requires account permission, an empty account exposure check, valid broker specifications, and sufficient risk and margin allowances. A valid signal can therefore produce no trade.

How to read the refinements

The proposed thresholds in this document are explicit starting values for comparison in testing. They have no demonstrated performance advantage yet. Each preset should be evaluated separately on its intended broker and symbol. The existing automated tests check software behavior; they do not establish a profitable strategy.
